

```

user: the build fails on the parser
branch, can you take a look?
assistant: running the tests first.
tool: pytest -q: 3 failed, 41
passed.
assistant: the lexer returns bytes
where the parser expects str;
patching lexer.py and running again.
tool: 44 passed.
user: great, now make it stream the
file instead of loading all of it
into memory.
assistant: switching read() to an
iterator over chunks, with a small
carry buffer for tokens split across
chunk boundaries.
tool: 46 passed, peak memory 38 MB,
down from 1.2 GB.
user: add a test for a token split
exactly at a boundary.
assistant: added test_split_token
with chunk sizes 1, 2 and 7.
tool: 47 passed.

```

```

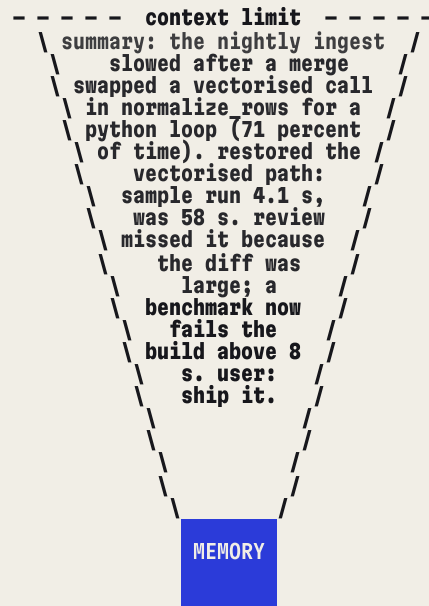

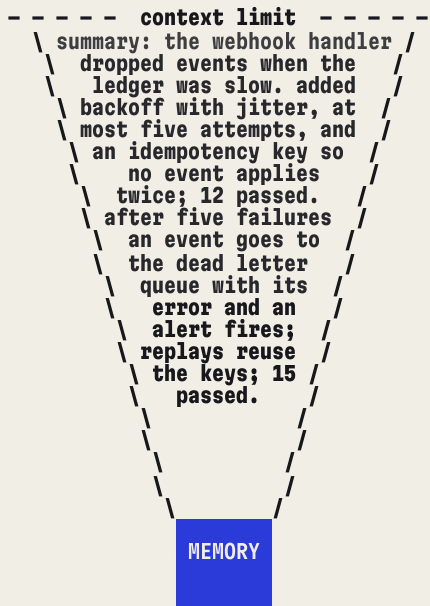

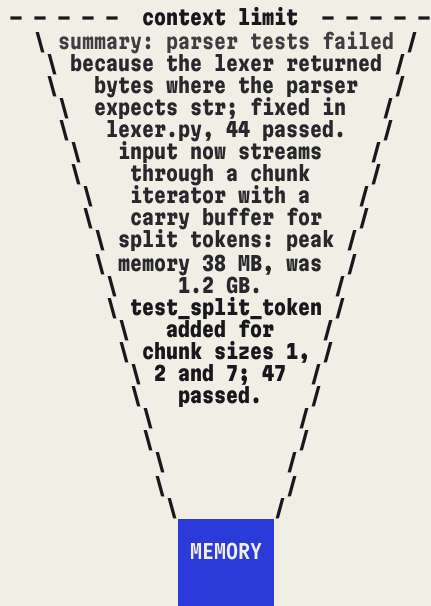

user: add retries to the payment
webhook handler, it drops events
when the ledger is slow.
assistant: reading handler.py and
the queue config.
tool: grep retry: no matches.
assistant: adding exponential
backoff with jitter, at most five
attempts, and an idempotency key so
a retried event is never applied
twice.
tool: 12 passed.
user: what happens after the fifth
failure?
assistant: the event goes to the
dead letter queue with the last
error attached, and an alert fires.
user: and replays?
assistant: a replay command reads
the dead letter queue in order and
reuses the same idempotency keys.
tool: 15 passed.

```

```

user: the nightly ingest job got
slow after yesterday's merge, can
you profile it?
assistant: running it with the
profiler on a one percent sample.
tool: 71 percent of time in
normalize_rows.
assistant: the merge replaced a
vectorised call with a python loop
over every row. restoring the
vectorised path and adding a
benchmark so it cannot regress
silently.
tool: sample run 4.1 s, was 58 s.
user: why did review miss it?
assistant: the diff was large and
the loop looked equivalent; the
benchmark now fails the build if the
sample run exceeds 8 s.
user: good, ship it.

```

```
ctx = [summarize(old_turns)] + recent_turns if tokens(ctx) > limit else ctx
```
